

Background of Holographic Scaling

The technology Holographic Scaling is based on the following principles:

- Scale Invariance;
- Holographic Principle;
- Similar Information Causes Similar Patterns;
- Synchronicity;
- An intention is Connection.

Scale Invariance

The universe obeys certain mathematical principles. These mathematical principles are independent of the scale of a phenomenon. This is called 'scale invariance'. If something looks the same at all scales, we call the structure with this self-similarity a fractal. Everywhere in the universe we can find these geometrical fractal patterns: crystal lattices, Brownian motion of gas molecules, polymer molecules, star clusters, cirrus-clouds, rings of Saturn, distribution of moon craters, branching of plants, growth of Nautilus-shells.

Holographic Principle

Gerard 't Hooft, a Dutch theoretical physicist discovered the "Holographic Principle".

The theory suggests that the entire universe can be seen as a two-dimensional information structure "painted" on the cosmological horizon, such that the three dimensions we observe are only an effective description at macroscopic scales and at low energies. The physical universe is widely seen to be composed of "matter" and "energy". Yet a growing group of scientists regards the physical world as made of information, with energy and matter as incidentals.

Similar information causes similar patterns

A Japanese researcher, Dr. Masaru Emoto, has demonstrated experimentally that water crystals converge into patterns which are geometrically similar when frozen slowly and informed with the same information, regardless of the medium of this information. Whether the word "love" is written on a label on a bottle of water, spoken near the bottle of water or if people only visualize that the bottle of water contains "love", seems to make little difference. The results always crystallize similarly and are significantly different when using the word "hate".

Synchronicity

A Swiss psychologist named Carl Gustav Jung coined the word "synchronicity" to describe the experience of events that are apparently causally unrelated, yet occur together in a meaningful manner. Synchronistic events reveal an underlying pattern, a conceptual framework that encompasses, but is larger than any of the systems that display the synchronicity. Following discussions with both Albert Einstein and Wolfgang Pauli, Jung believed that there were parallels between synchronicity and aspects of relativity theory and quantum mechanics.

An Intention is a Connection Between a Subject and a Desired State
Lynne McTaggart, architect of a series of scientifically controlled, web-based experiments testing the power of intention to change the physical world. Thousands of volunteers from 30 countries around the world have participated in Intention Experiments thus far. These experiments suggest that living things register information from the entire environment, and not simply between two communicating entities. This series of studies suggests that distance from which intention is sent doesn't have any bearing on the results. A group of people scattered around the globe produced the same effect as a group of 600 located thousands of miles away from the target.

Holographic Scaling

After discovering that computers were capable to do similar experiments without a human operator present, we created a service infrastructure which uses the distributed nature of the internet to empower our clients. It is now possible to schedule fully-automated "reconnect sessions" after analyzing which information may benefit an entity under study.
